# Proposal to Encode Additional Phonetic Modifier Letters in the UCS

**Date:** 2003-06-07  
**Author:** Peter Constable, SIL International  
**Address:**  
7500 W. Camp Wisdom Rd.  
Dallas, TX 75236  
USA  
**Tel:** +1 972 708 7485  
**Email:** peter_constable@sil.org

## A. Administrative

1. **Title**  
Proposal to Encode Additional Phonetic Modifier Letters in the UCS  
2. **Requester’s name**  
SIL International (contact: Peter Constable)  
3. **Requester type**  
Expert contribution  
4. **Submission date**  
2003-06-07  
5. **Requester’s reference**  
6a. **Completion**  
This is a complete proposal  
6b. **More information to be provided?**  
Only as required for clarification.

## B. Technical—General

1a. **New Script? Name?**  
No  
1b. **Addition of characters to existing block? Name?**  
Yes — Phonetic Extensions  
2. **Number of characters in proposal**  
49  
3. **Proposed category**  
A  
4. **Proposed level of implementation and rationale**  
1 (no combining marks or jamo)  
5a. **Character names included in proposal?**  
Yes  
5b. **Character names in accordance with guidelines?**  
Yes  
5c. **Character shapes reviewable?**  
Yes  
6a. **Who will provide computerized font?**  
SIL International  
6b. **Font currently available?**  
Yes  
6c. **Font format?**  
TrueType  
7a. **Are references (to other character sets, dictionaries, descriptive texts, etc.) provided?**  
Yes
7b. Are published examples (such as samples from newspapers, magazines, or other sources) of use of proposed characters attached?  Yes

8. Does the proposal address other aspects of character data processing? Yes, suggested character properties are included (see section E).

C. Technical—Justification

1. Has this proposal for addition of character(s) been submitted before? No

2a. Has contact been made to members of the user community? Yes

2b. With whom? Linguists

3. Information on the user community for the proposed characters is included? Linguists

4. The context of use for the proposed characters Linguistics text books, linguistic descriptions (books, journal publications, etc.); dictionaries.

5. Are the proposed characters in current use by the user community? Yes

6a. Must the proposed characters be entirely in the BMP? Preferably

6b. Rationale? If possible, should be kept with other phonetic symbols in the BMP.

7. Should the proposed characters be kept together in a contiguous range? Preferably

8a. Can any of the proposed characters be considered a presentation form of an existing character or character sequence? These characters have the same appearance as superscript forms of existing characters.

8b. Rationale for inclusion? Like other modifier letters used for phonetic transcription, these need to be considered distinct characters and not presentation forms of existing characters.

9a. Can any of the proposed characters be considered to be similar (in appearance or function) to an existing character? No

9b. Rationale for inclusion? n/a

10. Does the proposal include the use of combining characters and/or use of composite sequences? No.

11. Does the proposal contain characters with any special properties? No.
## D. SC2/WG2 Administrative

1. Relevant SC2/WG2 document numbers
2. Status (list of meeting number and corresponding action or disposition)
3. Additional contact to user communities, liaison organizations, etc.
4. Assigned category and assigned priority/time frame

Other comments

## E. Proposed Characters

A code chart and list of character names are shown on a new page.

xx30 | MODIFIER LETTER SMALL THETA
    | = \text{\texttt{<super> 03B8}}

### E.3 Unicode Character Properties

All of the proposed characters should have a general category of Lm. Compatibility decompositions should be as shown above. Other properties should match those of similar characters, such as U+02E1 MODIFIER LETTER SMALL L.

Note that the proposed compatibility decomposition for xx04 MODIFIER LETTER SMALL REVERSED OPEN E is \texttt{<super> 025C}. The existing character U+1D4C MODIFIER LETTER SMALL TURNED OPEN E currently has a compatibility decomposition mapping of \texttt{<super> 025C}. It is suggested that the latter mapping is in error, and proposed that U+1D4C should rather have a compatibility decomposition mapping of \texttt{<super> 1D08}.

Note also that the proposed compatibility decomposition for xx12 MODIFIER LETTER SMALL L WITH PALATAL HOOK is to a character that is not yet encoded, but has been proposed for encoding in a separate document, submitted at the same time (Constable 2003).

### F. Other Information

In general, modifier letters are used in phonetic transcription to represent secondary aspects of articulation. Secondary articulations may involve aspects of simultaneous articulation that are considered to be in some sense less dominant to the basic sound (for instance, nasalized vowels are typically conceived in terms of their oral counterparts but with the additional secondary articulation of nasalization); or they may involve a transitional articulation of a type that might otherwise be considered a complete speech sound in its own right but for various
reasons is interpreted by the linguist as a secondary element in a complex speech sound (for instance, diphthongs, or nasal onset of oral stop consonants). In some situations, the recommended transcription using the International Phonetic Alphabet would not involve a modifier letter; thus, many of the proposed characters are not officially-approved IPA notation. Nevertheless, the use of these modifier letters is fairly commonplace among linguists, even those that advocate the use of IPA.

The proposed modifier letters are of two types: those used in phonetic transcription to represent vowel-like sounds, and those used to represent consonantal sounds. These two groups will be discussed separately.

F.1 Vowel modifier letters

Vowel modifier letters are often used by linguists in transcribing diphthongs. Diphthongs are speech sounds involving two distinct but sequentially-contiguous vocalic gestures — two vowel targets. For instance, whereas the Spanish phoneme /e/ is typically spoken with a single vowel target, [e], the English phoneme /e/ is very often spoken with two vowel targets, [e] and [i]. Following the conventions of IPA strictly, the English phoneme could be transcribed as [ei] or [eɪ]. Occasionally, though, linguists will transcribe such a diphthong as [eᵢ] or [eᵢ], according to which component is considered to be secondary — an “on-glide” or an “off-glide”:

![Figure 2.8.1 Vowel onglide and offglide](image)

Figure 1. Vowel modifier letters used to indicate “on-glide” or “off-glide” diphthongs (Clark and Yallop 1995, p. 35).

Vowel modifier letters are also sometimes used to transcribe syllables that have a marginally-vocalic nucleus or a vocalic nucleus of very short duration, such that the vowel component of the syllable seems suppressed in relation to the consonantal components.

There are already a number of vowel modifier letters encoded in the UCS. Most of these were added in Unicode 4.0 and are in the Phonetic Extensions block:
This covers those vowel sounds that are most commonly encountered in the world’s languages. This list does not include all vowel symbols used in phonetic transcription, however, and in principle, any vowel gesture may potentially be one of the targets in a diphthong. Ladefoged and Maddieson (1996, p. 322) comment, “The kinds of vowels that occur as targets in diphthongs are no different from those that occur as single vowels.” Accordingly, the vowel modifier letters proposed here include all those that would need to make up a complete inventory of vowel modifier letters following common conventions for transcribing vowel sounds, as found in the IPA and Americanist traditions:

1 While IPA is increasingly prevalent, the Americanist tradition is still in use, and the use of superscripts to transcribe diphthongs may be more prevalent among those that use Americanist conventions. Some vowels in the Americanist system use diacritics, but it is assumed that combining marks can be used in sequences with modifier letters as well as with other letters. Capital vowel letters are used by some in the Americanist tradition to transcribe voiceless vocoids, but this proposal does not include modifier-letter counterparts to Latin capital vowel letters. I am not aware at the present time of a user need for capital vowel modifier letters in order to transcribe a voiceless, secondary component of a diphthong using Americanist conventions.
The vowel portion of the overall proposal is summarized in Table 2:

---

2 There is some variation within Americanist usage. Whereas Pullum and Ladusaw show a small capital I for the front unrounded lower-high vocoid, many represent this vocoid using small iota. Also, some use a small v with hook for the back round lower-high vocoid, rather than the small capital u shown here. Barred iota and barred v-hook for central lower-high vowels are not used, however.
The following samples serve to illustrate the use of vowel modifier letters in general to transcribe diphthongs. The samples will contain vowel modifier letters that are already encoded as well as ones being proposed; those already encoded will be highlighted in blue; those being proposed, in red.

Samples were obtained for several but not all of the characters listed in Table 2. This should not be seen as an obstacle to encoding, however, since the rationale for inclusion of these characters is based not on the ability to demonstrate attested usage of each, but rather on a well-defined inventory and established conventions that can be readily documented. The samples provided here demonstrate these conventions in use in a varied sampling of the literature.

(33a) N  klhp[ə]nən  ‘latigo’
(33b) s  skillyəlaqstxən  ‘sliver in lower leg’
(33c)  ciyətk*eptə  ‘build/start a fire’

- **Schwa**
  - Vowels: a, e
  - F1: 566, 526, 713, 768
  - F2: 519, 1577, 1121, 1489
  - F1: 369, 378, 615, 554
  - F2: 1518, 1447, 979, 1496

Figure 10. Vowel modifier letters: open-e, schwa, i, i-bar, o, u, turned-v (Wayland and Allard 2001, p. 76).

listed in the earlier table), the initial voiced stops are unexploded. These are not sequences of the form [d押], but are simply homorganic pairs of stops, with the first member being voiced and unreleased, and the second being voiceless and, on some occasions, also ejective and affricated.

Figure 11. Vowel modifier letters: schwa (Ladefoged and Maddieson 1996, p. 80).
Note the following in relation to Figure 12: there are some variations within the Americanist tradition, and this source uses a small v with hook to represent back round lower-high vocoid whereas other Americanists may use small capital u. The small v with hook is used as a consonant symbol within IPA, and the corresponding modifier letter is discussed below. Therefore, under this proposal, the MODIFIER LETTER SMALL V WITH HOOK would be available, whether for use by Americanists to represent a back round lower-high vocoid, or for use by others to represent labiodentalization.

F.2 Consonant modifier letters

Consonant modifier letters are often used to transcribe articulatory modifications that may apply to a wide variety of consonantal sounds, such as aspiration (typically transcribed as \( ^h \)) or labialization (typically transcribed as \( ^n \)). Consonantal modifier letters can also be used to transcribe sounds that involve a secondary consonantal articulation in addition to the dominant consonant, either simultaneously or as a transitional effect, such as a lateral release (typically transcribed as \( ^l \)).

The most commonly-used consonant modifier letters are already encoded in the UCS. Several others are also in use, however. The inventory that seems to be needed includes nasals (e.g. to transcribe nasal onset or release of oral stops), fricatives (for fricative release of stops), approximants and some stops. Modifier counterparts for other symbols, such as clicks and trill, are not required. The samples shown below demonstrate attestation of most of the proposed inventory. The proposed consonant modifiers are listed along with an index to the samples illustrating each one in Table 3 to Table 6.

Note that a modifier counterpart to small c is proposed. The small letter c is used to represent a palatal stop. In fact, the modifier that is attested (see Figure 18) is c-cedilla, which represents a palatal fricative. It is assumed that that an voiceless affricate with a secondary palatal fricative component can be represented using a sequence < modifier letter small c, combining cedilla >.

Note also that modifier letters l-palatal hook and t-palatal hook are proposed. While the use of palatal hook for indicating palatalization is no longer an IPA recommendation, l-palatal hook and t-palatal hook are proposed here because they are attested, as seen in the samples.

Proposal to Encode Additional Phonetic Modifier Letters in the UCS

Peter G. Constable   June 08, 2003   Rev: 81

Figure 13. Consonant modifier letter: s-hook, z-curl, z-retroflex hook, n-lefthook, small capital L (Laver 1994, p. 559).

Figure 14. Consonant modifier letter: n-left hook, n-retroflex hook, small capital n (Laver 1994, p. 583).

Figure 15. Consonant modifier letter: n-left hook, n-retroflex hook, small capital n (Laver 1994, p. 584).

sequence (ibid., p. 16). Sequences spanning a morpheme boundary furnish many examples of two-phoneme sequences. The difference is shown by the words ki:ti “circumcised boy” and kar.kap.-ti “kitehawk-erg.”

Figure 19. Consonant modifier letter: eth, z, ezh, z-retroflex hook, crossed-tail j (Laver 1994, p. 581).
Affrication is transcribed in any of three ways. One way is to write a small superscript homorganic fricative symbol after the stop symbol, as in [f]. The alternative modes of transcription involve writing both components on the line and either joining them with a linker diacritic, as in [tˢ], or joining the two symbols physically together, as in [ts].

otherwise. However, the conventional way of transcribing preploded nasals, i.e. a nasal preceded by its homorganic stop [b̥m, d̥n, g̥ŋ], has been retained in the present material.

Second, as also acknowledged by Bishop (1996:235) for Kensiw, the preploded nasals are historically and cognitively developments from simple nasals and have simple nasal reflexes in other Mon-Khmer languages. Importantly, reduplications of preploded nasals are always realised as the simple nasal counterpart: [sɔmsɔ̆m] /sɔmsɔm/ ‘to buzz around a nest’, [hɔnɔ̆n] /hoot/ ‘to devour’, [jɪnjejɪn] /jɪnjej/ ‘to dream’, [pəŋəŋ] /pəŋəŋ/ ‘wide’. Furthermore, Malay loanwords which originally have final nasals are usually realised with the preploded counterpart: [hajə̆m] from Malay ayam ‘poultry’, [bulaŋ] from Malay bulan ‘moon’, [kuə̆m] from Malay kucing ‘cat’.

The little things would stick on, just like a garment.

and Polish. As shown in (3), the stem-final consonants /t d/ in Polish (Rubach 1984) are affricated into the alveolo-palatals [t* d*] when followed across a morpheme boundary by the locative singular /e/, verbalising /ei/ or the feminine suffix /it/+a/, by virtue of Coronal Palatalisation.

(3) **Polish Coronal Palatalisation** (Rubach 1984)

Another source of sibilant affricates is Strident Assimilation, as in Polish (Rubach 1994). The anterior obstruents /t d/ in Polish are optionally affricated before sibilant fricatives or affricates within a lexical item or across word boundaries, as shown in (4).

(4) **Polish Strident Assimilation** (Rubach 1994)

Similarly, there is a sound change from Proto-Bantu to Mvumbu which also shows plosive assibilation before the high vowels /i/ and /u/. As shown in (14a), the plosives /b d t g k/ in Proto-Bantu were affricated in Mvumbu, to /dʒ/ before /i/ or to /bʱ/ before /u/. But plosives before non-high vowels in Proto-Bantu were not affricated in Mvumbu, as in (14b) (from Ohala 1983, after Guthrie 1967–71).

(14)  

\begin{align*}
\textbf{Proto-Bantu} & \quad \textbf{Mvumbu} \\

\end{align*}

In contrast, the underlying plosives /t d/ in Quebec French are usually affricated into [tʰ dʰ] only before high front vowels. As shown in (15), the consonants /t d/ are affricated before the high front vowel /i/, the high front rounded vowel /y/, the palatal glide /j/ or the high front rounded glide /u/ within a morpheme (Charbonneau & Jacques 1972, Cedergren et al. 1991, Ostiguy & Tousignant 1993, Papen 1998).

Figure 34. Consonant modifier letters: l-retroflex hook, l-palatal hook (Evans 1995, p. 735).

Note that there is a typographic anomaly in the sample shown in Figure 34: retroflex (right-turning) hooks have been used on the t and modifier l, but the author was clearly discussing palatalization. What the author was intending, then, was a modifier l-palatal hook. It is not clear whether this was a typographic error or merely an attempt to approximate the palatal hook to compensate for an incomplete selection of type.

Figure 35. Consonant modifier letter: t-palatal hook (Halle 1971, p. 71).

Figure 36. Consonant modifier letters: turned-m with long leg (Golston and Kehrein 1998, p. 323).
